

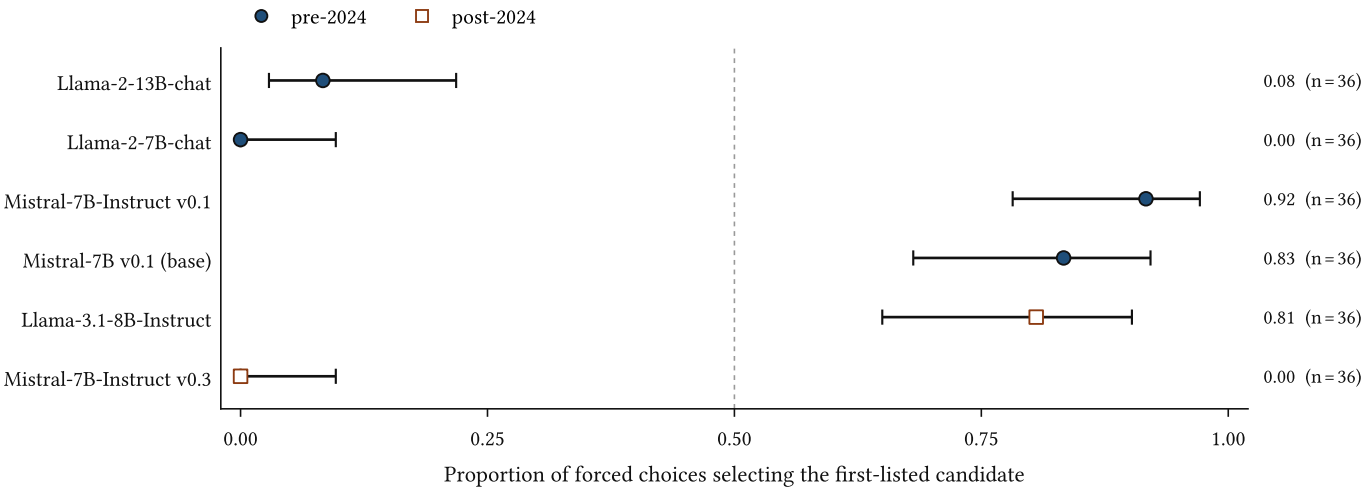

Figure 1. Forced-choice screening tracks prompt position rather than the candidate. Two résumés identical except the candidate's name, presented in both orders; an unbiased screener sits at 0.50. Bars are Wilson 95% intervals. The direction reverses within a model family across one generation: Mistral-7B-Instruct moves from 0.92 to 0.00 between v0.1 and v0.3, and the Llama family moves from 0.00 to 0.81.
