

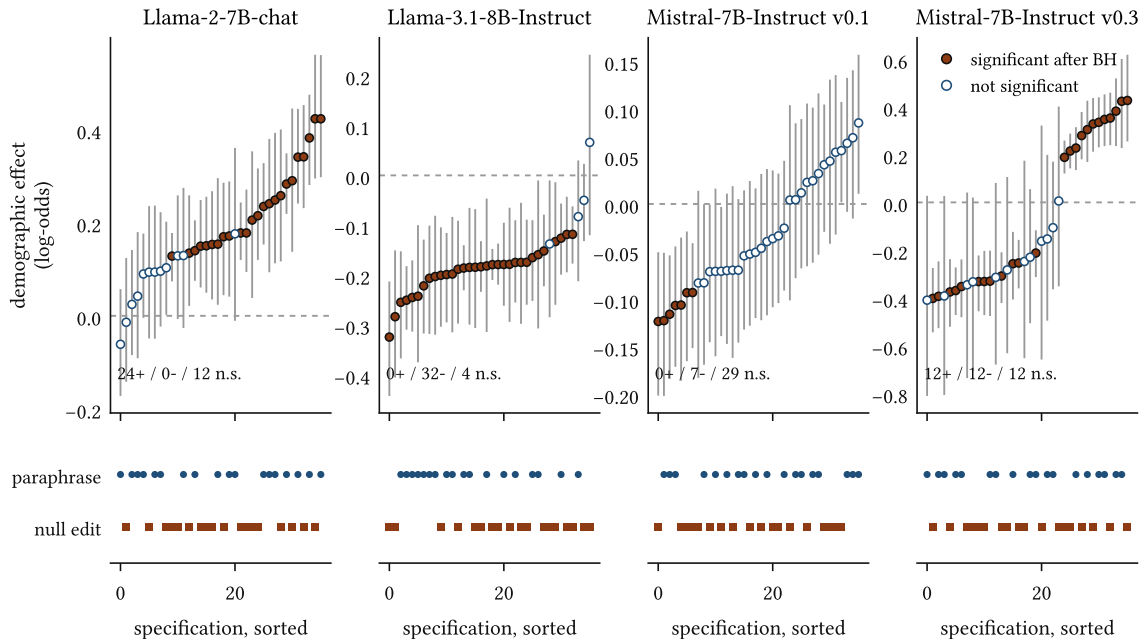

Figure 2. Every defensible analysis of the same data, sorted by the answer it gives. Thirty-six specifications per model: twelve wordings that ask the same question, crossed with three résumé templates. Each is an analysis a researcher could have run and published. Bars are 95% bootstrap intervals; filled points survive Benjamini-Hochberg across that model's thirty-six specifications. On Mistral-7B-Instruct v0.3 twelve specifications are significantly positive and twelve are significantly negative, so the sign of the reported effect is determined by a choice the method section does not usually record. The lower strip marks whether each specification came from a paraphrase or from an edit that changes no meaning at all; the two do not separate.
